

## **Enterprise IT - Internal Kubernetes Troubleshooting Guide v1.4**

**Handling Error 88X: "Payment Gateway CrashLoopBackOff"** If the payment-service-pod in the kube-system namespace enters a CrashLoopBackOff state and throws an Error 88X, it means the pod cannot reach the Upstash Redis cache.

### **Resolution Steps:**

1. Do not restart the pod immediately.
2. First, verify the VPC peering connection between the primary EKS cluster subnet and the Redis security group.
3. Run the internal CLI command: `kubectrl check-redis-peering --namespace kube-system`
4. If the peering shows "Disconnected", escalate to the Tier 3 Network team. Do not attempt a manual reboot as it will flush the dead-letter queue.
